

Images should be kept to around 70-100 Kb in size.

Computer screens cannot display the quality of images that modern cameras produce (Megapixels). To make uploading/downloading images faster for users of a website it is best to use file sizes based on computer screen resolution (i.e. the smallest size for the same result). On a computer screen a 100Kb file will look exactly the same as a 1Mb file but be 10 times faster.

Here are some utilities to help you quickly adapt image size to suit Vespa Labs

[Microsoft PowerToys for Windows XP](#) use "Image Resizer" to right-click and resize files.

To get the same functionality on Vista use [Image Resizer Powertoy Clone for Windows](#)
